

Stedham Primary School

Intent

At Stedham we know that science, influences all aspects of everyday life. From the food we eat to the way we get around, science is everywhere. Science helps shape a child's development. As they learn to ask questions, make predictions, observe, test and then communicate their findings children discover the world around them. Over time the relationship between science and critical-thinking skills become apparent.

Implementation

At Stedham, children learn through practical activities which develop their investigation skills and encourage a desire to find out about the world around them. Science is taught in blocks to provide the children with an immersive experience. Where further time can be given to understand the topic and conduct investigations to improve their investigative skills.

Impact

Children at Stedham learn about living things, materials and states of matter, light, forces, sound, electricity and earth and space. We encourage children to discover, investigate, ask questions, observe, collaborate, predict, investigate and conclude. Children are taught to use the correct and appropriate scientific vocabulary to explain what they observe.
